ViewSmart 6400 Redundant Slave Port

R.C. Systems Inc. offers a full range of Gas Detectors and Alarm Controllers

ViewSmart 6400

Did you know that the R.C. Systems ViewSmart 6400 offers redundant Modbus ports? When paired with our SenSmart 6000 with dual modbus slave ports, you can achieve redundant communications on your entire system.

What is a Redundant Port?

Redundant Ports allow the user to create a port which uses the settings from a previously configured port. Redundant mode can be used with ports configured as Modbus Master. When configured as a redundant port, the primary port communicates until it gets a communication error. The ViewSmart 6400 will then switch to the redundant port and continue to poll the slave nodes.

This unique feature gives our customers the ability to maintain continuous communication in the event of a cut cable or other unforeseen electrical failures.
